

OIL-DRIP CATCHER

ABSTRACT OF THE DISCLOSURE

An inexpensive and replaceable fluid absorbing device for capturing fluid leaked from a machined assembly such as an oil pan or transmission is described. The device includes an absorbent material that absorbs the leaked fluid, which is attached to the first mounting strip and the first mounting strip is attached to a second mounting strip. The second mounting strip is attached to an exterior portion of the machined assembly. When the first mounting strip is attached to the second mounting strip, the absorbent material is positioned at a location where fluid leaked from the machined assembly is absorbed by the absorbent material. Once saturated with fluid, the device can be removed by simply detaching the first mounting strip from the second mounting strip and a new device can be attached.
